

SESAP — one guided run that proves the whole loop

A support lead acts in the app, Maestro orchestrates, the robot does the work and writes back to Data Fabric, and the app reflects it. Follow the steps in order — each is tagged with the exact requirement or bonus it demonstrates on camera.

Coded App

Data Fabric

↻ APP REFLECTS THE CHANGE

BEFORE YOU HIT RECORD

Five minutes of setup makes the take clean. Do these first.

- ☐ **Turn Live automation ON** — *Settings* → *Automation & Robot Units*. This lets a click actually fire Maestro + the robot + emails.
- ☐ **Open the app fresh** — new/incognito window, sign in again so you're on the latest revision. Sign in as the **Supervisor** (`admin` / `sesap2026`).
- ☐ **Resolve one or two tickets first** (off-camera) — this seeds the **Avg Resolution** KPI with a real value before you show Analytics.
- ☐ **Have two files ready** to drag in: a clear photo of an **ID card** and a **PDF** (statement or receipt).
- ☐ **Do one silent dry-run**: resolve a ticket, confirm the email lands (check spam); read one ID image in the copilot. If either misbehaves, fix it — don't record around it.
- ☐ **Second tab on Orchestrator** (Maestro monitoring + Jobs) so you can cut to the running instance without hunting.

The walkthrough

Eleven short beats, ~30–45 seconds each — lands comfortably inside the 5–8 minute window.

1

Open on the problem, name the platform

SAY *"Support leads have ticket data in Data Fabric but no place to act on it. SESAP is that place — a Coded App wired through Maestro to a robot, end to end."*

DO

- Start on the landing page; gesture at the four-layer loop.

Sets up all four layers

2

Sign in — three different experiences

SAY *"The same platform gives a supervisor, an agent, and a customer completely different views."*

DO

- Sign in as Supervisor → the Command Centre.
- Mention the agent login (ngozi) and customer (user).

Baseline 4.1 · runs & connects

Bonus +3 · Role-based views

3

The live operational view

SAY *"Every active ticket, read live from Data Fabric — searchable and sortable the way a support lead actually works."*

DO

- Open **Ticket Queue**. Search a term; sort by priority; toggle the **Date Logged** column.

Baseline 4.1 · list from Data Fabric

Baseline 4.1 · search & sort

4

Team performance — the analytics dashboard

SAY *"Real metrics, computed from the live tickets — not mock numbers. Here's the operational picture in one screen."*

Open tickets + open-by-priority breakdown

Avg Resolution time in hours — now populated

SLA compliance % across active tickets

Created vs Resolved volume trend chart

- DO**
- Open the dashboard; slow down on each KPI card.
 - Point out **Avg Resolution** shows a real value — it reads the ticket's last-update time from Data Fabric, so resolving tickets moves it.
 - Let the created-vs-resolved chart and automation-health bar land.

Bonus +3 · Analytics & KPIs

5

Open a ticket — and read a document out loud

SAY *"Full record on one screen. And the assistant can actually read an attachment — here's an ID card."*

- DO**
- Open a ticket → the full detail view.
 - Open the **AI Copilot** → drag in the **ID-card image** → it OCR-reads the text back.
 - Drag in the **PDF** → it extracts and summarises the text.

Baseline 4.1 · ticket detail view

Bonus +4 · Document IDP

6

Create a ticket — this is the trigger

SAY *"Raising a ticket writes it straight to Data Fabric and kicks off the orchestration — this one click starts everything."*

- DO**
- Confirm **Live automation is ON**.
 - Create a ticket, submit → toast confirms it saved to Data Fabric.

Baseline 4.1 · create persists to DF

Baseline 4.2 · Ticket entity write

Baseline 4.1 · action starts orchestration

7

Cut to Maestro orchestrating it

SAY *"That click started a Maestro process modelling the ticket lifecycle — triage, route, decide, assign — and an AI agent does the triage."*

- DO**
- Orchestrator → newest **TicketLifecycle** instance.
 - Trace start → the triage/route gateway → the branch taken.

Baseline 4.4 · BPMN start/tasks/gateway/end

Baseline 4.4 · models the lifecycle

Bonus +6 · Agentic AI triage

8

The robot does the work and writes back

SAY *"Maestro hands off to the published robot: it categorises with AI, auto-assigns to the right team, and writes the status back to Data Fabric — Unassigned becomes Assigned."*

- DO**
- Show the **TicketAutomation** job (Successful) in Jobs.
 - Call out **AssignmentStatus** flipping in Data Fabric.
 - Point to the notification email (you're CC'd).

Baseline 4.3 · published RPA, real task

Baseline 4.3 · reads/writes DF

Baseline 4.2 · status write-back

Bonus +2 · Notifications

9

Back to the app — the loop closes

SAY *"And back in the app, no refresh needed — the ticket is now assigned. Trigger to visible result, the full loop."*

- DO**
- Return to the queue/ticket → now reads **Assigned** with the team the robot set.

Baseline 4.3 · invoked by orchestration

Baseline 4.5 · full loop, demonstrated live

10

Act on the lifecycle — resolve, escalate, approve

SAY *"Every action drives its own Maestro branch and its own email — and the platform watches SLAs and routes approvals on its own."*

- DO**
- **Resolve / Close / Escalate** a ticket → each fires the matching Maestro branch + email.
 - Show an **overdue** ticket auto-escalated to Urgent, supervisor alerted.
 - Raise a **procurement / reimbursement** ticket → it routes to supervisor **approval**; approve or reject, surfaced in the app and by email.

Bonus +3 · SLA & escalation

Bonus +4 · Human-in-the-loop

11

Close on the engineering — this isn't a prototype

SAY *"Under the polish it's built properly: an automated test suite, reusable components, and error handling that degrades gracefully instead of crashing — on a genuinely on-brand banking UI."*

- DO**
- Cut to a terminal and run `npm test` → **11 passing** (SLA math, analytics, email/export builders).
 - Mention graceful degradation: if Data Fabric or OCR is unavailable, the UI still works — it never blocks or throws.
 - End on the dashboard so the last frame is the polished, on-brand interface.

Bonus +3 · Engineering quality

Bonus +2 · Polished UX

Coverage — say this at the close

"Every baseline item is met, and nine bonus tracks are in — capped at the +25 maximum."

Baseline — all met

Section 4 · the mandatory floor

- ✓ **4.1 Coded App** list · search · sort · detail · create · trigger
- ✓ **4.2 Data Fabric** Ticket entity · status write-back
- ✓ **4.3 RPA workflow** published · reads/writes DF · orchestrated
- ✓ **4.4 Maestro BPMN** start · tasks · gateway · end · invokes RPA
- ✓ **4.5 End-to-end** full loop, live

Bonus — nine tracks

Section 5 · added on top, capped at +25

- ✓ **Agentic / AI triage** +6
- ✓ **Document IDP** +4
- ✓ **Human-in-the-loop** +4
- ✓ **SLA & escalation** +3
- ✓ **Role-based views** +3
- ✓ **Analytics / KPIs** +3
- ✓ **Engineering quality** +3
- ✓ **Notifications** +2
- ✓ **Polished UX** +2

Requested **30 → capped +25**
